Basic introduction about the scenario

- Lanka Tours is a renowned tour operator in Sri Lanka since 2015.It organic custom private trips to locals and foreigners from individual to large groups.

- Lanka tours needs to implement a new database application to deliver a satisfactory service. They need their system to generate management reports, print customer bills and tour itinerary

  We identified seven entities in the above given scenario.
  - ✓ Payments are directly linked to the customer, both the reservation payment and the full payment.
  - ✓ Reservation process is handled via an employee.
  - ✓ Employees are divided to guides, receptionists, drivers. Sometimes one employee can serve two purposes.
    - i.e. guide and driver both.

✓ There is a possibility of an employee becoming a customer as well.

Additional Assumptions

- Vehicle rate per kilometer depends on vehicle type.
- The same person makes the reservation and payment.
- The reservation should be produced, when making the advance payment.
- Employee should be a local resident.
- The pickup and drop location of a foreign can be the airport.
- Employee can also be a customer. We assume as an entity, “Special” in EER-Diagram.
- Customer contact number, fax-no and email can be possible empty.
- Assume that tour-type can be made by Lanka tours or the guest of their interests.
- Each guide is paid Rs5,000 per day and an additional 5% allowance of the total tour package.
- An additional 3% allowance of the total tour-package is paid for the drivers and the vehicle.
- When making reservation, guests must pay an advance payment of the 50% of their tour package.

Cardinality Ratios

1. One payment is relevant for one reservation (1:1)
2. One customer can have many payments(1:M)
3. One employee can become a customer (1:1)
4. One employee can handle many reservations(1:M)
5. Each reservation can have only one tour (1:1)
6. One tour can have many vehicles(1:M)
7. Each tour has more than one itinery(1:M)
8. One customer can make many reservations(1:M)

Ciritical Appraisal

- The main feature of the database is that the integrity of the data we have used for the details. There we have managed to come with actual tour management system situation data.

- Most of the fields in the tables are applied with triggers and the users of the system can manipulate or deal with the database with less number of errors.

- In some cases, user might find it difficult to insert data for some tables as they are applied with triggers. When a trigger is fired sometime errors to the ongoing process can occur, as an example interruptions and system crashes.

Futher Implementation

- We will connect this database to real world tour management systems and plan develop separate software to this database.

- From the data retrieval, insertion and other manipulations can be done in a user-friendly way.

- After creating the user interfaces for the database, every person can easily deal with this database.

- Advanced triggers added to the database , therefore it reduce the errors that can be happen from the users when inserting and manipulating data.
- After creating the database, can reduce too large space decreasing to many free spaces in the space allocated for the database.

Work Load Matrix
